☆ User types

⊕ System Admin Acc
  - Create / Delete Bank Official Acc
  - Create Acc Type → new Class
  - Delete Acc type → delete Class ???

  - ID / Password
    + can be normal or special (having the 1st char as 'A' for example
    + ID can be — randomly generated
                  \ set by user
    + Requirements 4 password (optional)

  - Date + time login - should we do a
    history file or variable (Optional)
         ↑
      I prefer this one

  - Retrieve any user idea
    + With name / phone number / ID ???
    + List all user info for them to choose?

⊕ Bank official

+ Open/closed acc
  - closed not deleted - change the flag
  - set variable ┌ time closed
              └ person who closed
+ Deposit/withdraw — w/ customer ID + password

+ Search - can be duplicated except the ID

⊕ Customer

+ There can be multiple acc with same info, but ID must be unique
  ○ If we can generated ID it would be ez to use vector ┌ 1st customer ID is 00001
                                                        └ 2nd _____ 00002
                                                          . . . .

  ⇒ ez to access (random-accessing data) don't have to worry about disadvantage, b/c we would only pushback and do not delete any acc (just disable it)

+ Transaction history: I suggest separate file
